Table of annex

Separate document annex 1: Measurement diagrams

Separate document annex 2: External photographs of EUT

Separate document annex 3: Test set-up photographs

Separate document annex 4: Internal photographs of EUT

Separate document annex 5: Comparison of the radiated field strength emissions test results for EUT A and EUT B in frequency range 960 MHz - 1610 MHz. Explanation of the results.

The listed attachments are an integral part of this report.

1. Summary of test results

The test results apply exclusively to the test samples as presented in this report. The CETECOM GmbH does not assume responsibility for any conclusions and generalizations taken in conjunction with other specimens or samples of the type of the item presented to tests. Also we refer on special conditions which the applicant should fulfill according §2.927 to §2.948, special focus regarding modification of the equipment and availability of sample equipment for market surveillance tests.

The presented Equipment Under Test (in this report, hereinafter referred as EUT) supports radiofrequency technologies with similar UWB technology and operating frequency range at 3.1 to 4.8 GHz. Other implemented wireless technologies were not considered within this test report.

Following test cases have been performed to show compliance with valid Part 15.209/15.517 of the FCC CFR Title 47 Rules, Edition 4th November 2014.

1.1. Tests measurement overview according of US CFR Title 47, Subpart 15C:

			ces & Limits		EUT	
Test cases	Test cases Port FCC Standard Test Limit		EUT set-up	opera- ting mode	Result	
		TX	K-Mode			
Transmission time	Antenna terminal (radiated)	§15.517(a)(5)	-	3	2	passed

1.2. Attestation:

I declare that all measurements were performed by me or under my supervision and that all measurements have been performed and are correct to my best knowledge and belief to Industry Canada standards. All requirements as shown in above table are met in accordance with enumerated standards.

The current version of the Test Report 18-1-0039001T01a-C1 replaces the Test Report 18-1-0039001T01a dated 14.09.2018. The replaced Test Report is herewith invalid.

^{*)} EUT operating mode no. is used to simplify the test report.

4. Description of test system set-up's

4.1. Test system set-up for radiated magnetic field measurements below 30 MHz

Specification: ANSI C63.4-2014 §5.3, §8.2.1, §8.3.1.1+§8.3.2.1, ANSI C63.10-2013 chapter

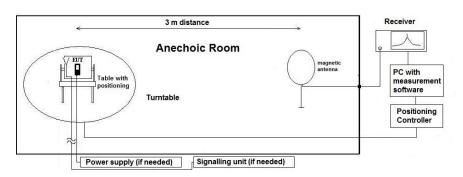

6.4 (§6.4.4.2)

General Description: Evaluating the radiated field emissions are done first by an exploratory emission measurement and a final measurement for most critical frequencies determined.

The loop antenna was placed at 1 m height above ground plane and 3 m measurement distance from set-up for investigations. Because of reduced measurement distance, correction data were applied, as stated in chapter "General Limit - Radiated field strength emissions below 30 MHz". The tests are performed

in the semi anechoic room recognized by the regulatory commission.

Schematic:

Testing method:

Exploratory, preliminary measurement

The EUT and it's associated accessories are placed on a non-conductive position manipulator (tipping device) of 0.8 m height which is placed on the turntable. By rotating the turntable (step 90°, range 0°to 360°) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2orthogonal axis (defined operational position of EUT), the emission spectrum was recorded. The loop antenna was moved at least to 2-perpendicular axes (antenna vector in direction of EUT and parallel to EUT) in order to maximize the emissions. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a data reduction table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Formula:

 $E_C = E_R + AF + C_L + D_F - G_A$

 $M = L_T - E_C$

Final measurement on critical frequencies

Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined.

Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself either over 3-orthogonal axis (not defined usage position) or 2-orthogonal axis (defined usage position).

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

AF = Antenna factor

 $C_L = Cable loss$

D_F= Distance correction factor

 E_C = Electrical field – corrected value

 E_R = Receiver reading

G_A= Gain of pre-amplifier (if used)

 $L_T = Limit$ M = Margin

All units are dB-units, positive margin means value is below limit.

Distance correction: Reference for applied correction (extrapolating) factors due to reduced

measurement distance:

ANSI C63.10:2013, $\S6.4.4.2$ - Equations (2) + (3) + (4)

4.2. Test system set-up for radiated electric field measurement 30 MHz to 960MHz

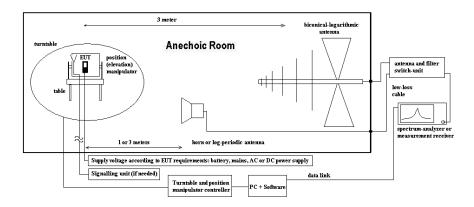

Specification: ANSI C63.4-2014 chapter 8.2.3, ANSI C63.10-2013 chapter 6.5

General Description: Evaluating the field emissions have to be done first by an exploratory emissions

measurement and a final measurement for most critical frequencies. The tests are performed in a NSA-compliant semi anechoic room (SAR) recognized by the

regulatory commissions.

Schematic:

Testing method:

Exploratory, preliminary measurements

The EUT and its associated accessories are placed on a non-conductive position manipulator (tipping device) of 0.8 m height which is placed on the turntable. By rotating the turntable (range 0° to 360°, step 90°) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2-orthogonal axis (defined operational position of EUT) the emission spectrum and it's characteristics was recorded with an EMI-receiver, broadband antenna and software.

Measurement antenna: horizontal and vertical, heights: 1,0 m and 1,82 m as worst-case determined by an exploratory emission measurements. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case of them. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Formula:

 $E_C = E_R + AF + C_L + D_F - G_A$ (1)

 $M = L_T - E_C \tag{2}$

Final measurement on critical frequencies

Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc. either on 10m OATS or 3m semi-anechoic room.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined.

Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself either over 3-orthogonal axis (not defined usage position) or 2-orthogonal axis (defined usage position). The measurement antenna height between 1 m and 4 m.

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

AF = Antenna factor

 $C_L = Cable loss$

 $D_F = Distance \ correction \ factor \ (if \ used)$

 E_C = Electrical field – corrected value

 E_R = Receiver reading

 $G_A = Gain of pre-amplifier (if used)$

 $L_T = Limit$ M = Margin

All units are dB-units, positive margin means value is below limit.

4.3. Test system set-up for radiated electric field measurement above 960MHz

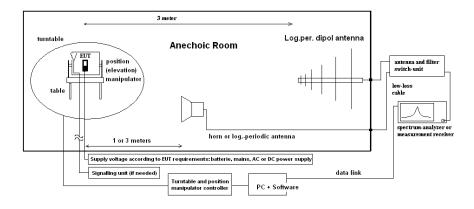

Specification: ANSI C63.10-2013, chapter 10.3

General Description: The tests are performed in a CISPR 16-1-4:2010 compliant fully anechoic room

(FAR) recognized by the regulatory commission. The measurement distance was set to 1 m or 3 m. Horn antennas are used for frequency range 1 GHz to 40 GHz. The EUT is aligned within 3 dB beam width of the measurement antenna with three

orthogonal axis measurements on the EUT.

Schematic:

Testing method: Exploratory, preliminary measurements

The EUT and its associated accessories are placed on a non-conductive position manipulator (tipping device) of $1.55~\mathrm{m}$ height which is placed on the turntable. By rotating the turntable continuously (range 0° to 360°) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2-orthogonal axis (defined operational position of EUT) the emission spectrum and it's characteristics was recorded with an EMI-receiver, broadband antenna and software.

The measurements are performed in horizontal and vertical polarization of the measurement antennas. The results are documented in a diagram. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Formula: $E_C = E_R + AF + C_L + D_F - G_A$ (1) $E_C = E$ lectrical field – corrected value

 E_R = Receiver reading

 $\begin{aligned} \mathbf{M} &= \mathbf{L}_{T} - \mathbf{E}_{C} \\ \mathbf{M} &= \mathbf{Margin} \\ \mathbf{L}_{T} &= \mathbf{Limit} \end{aligned}$

AF = Antenna factor

 $C_L = Cable loss$

 D_F = Distance correction factor (if used) G_A = Gain of pre-amplifier (if used)

All units are dB-units, positive margin means value is below limit.

5. Measurements

5.1. Transmission time measurement

Equipment set up	table top 1.5 m table top 1.5 m table top 1.5 m	height	☐ floor standing
Climatic conditions	Temperature: (22	±3°C)	Rel. humidity: (40±20)%

5.1.5. Measurement method and analyzer settings:

The measurement is made radiated. The EUT and the intentional radiator are in the FAR. The intentional radiator is located close by EUT. In this measurement intentional radiator is AE 3 (see chapter 3).

The measurement is made in time domain by the central frequency of the channel. Measurement duration 30 s. RBW = 1 MHz.

In the first measurement an intentional radiator is switched on. Then the measurement is started by the spectrum analyzer. It is checked, whether the EUT transmits, when the intentional radiator is switched on. The EUT transmits irregularly at least once within 30 s.

In the second measurement an intentional radiator is switched off. Then the measurement is started by the spectrum analyzer. It is checked, whether the EUT doesn't transmit, when the intentional radiator is switched off. The EUT doesn't transmit.

5.1.6. RESULTS

When the intentional radiator is off, the EUT doesn't transmit.

5.1.6.1. VERDICT: PASS. For graphical results pls. see annex 1 to this test report.

	Set-up)		

5.2.4. EUT Settings:

The measurement is made radiated. The EUT was instructed to transmit continuously with maximum power (if adjustable) according applicants declared and applicable settings.

Different characteristics have been checked, e.g. data rates which EUT can operate if applicable.

5.2.5. Measurement method:

The frequency at which the maximum power level is measured with the peak detector is designated f_M (RBW=1 MHz, VBW= 3 MHz, peak detection, maxhold). The outermost 1 MHz segments above and below f_M , where the peak power falls by 10 dB relative to the level at f_M , are designated as f_H and f_L . The UWB transmission, and the -10 dB bandwidth (B - 10), is defined as $(f_H - f_L)$. -10 dB bandwidth should be \geq 500 MHz and must be contained between 3100 MHz and 10.600 MHz.

5.2.6. Spectrum-Analyzer settings:

Span	1.5 GHz

2	9 kHz-30 MHz	1	Op. mode- worst case. Standing position.	Peak	passed

5.3.5. Correction factors due to reduced meas. distance (f< 30 MHz)

The used correction factors when the measurement distance is reduced compared to regulatory measurement distance, are calculated according Extrapolation formulas valid for EUT's with maximum dimension of 0.625xLambda. Formula 2+3+4 as presented in ANSI C63.10, Chapter 6.4.4 are used for the calculations of proper extrapolation factors.

1610-1990	-53.3
1990-3100	-51.3
3100-10600	-41.3
10600- 40000	-51.3

5.5.3. Measurement method:

Measurement method is described in general in chapter 4.4.

Due to the fact that limits especially in frequency range 960 MHz - 1990 MHz and 10600 MHz - 40 GHz are very low, the measurement distance for these frequency ranges is reduced to 1m. The spectrum analyzer is placed immediately after the receiving antenna. Preferably short RF cable is used for the connection of the antenna and the spectrum analyzer.

Frequency range	Measurement distance	
[MHz]	[m]	
960-1990	1	
1990-10600	3	
10600- 40000	1

6	6480 MHz	1	Op. mode- worst case. RBW = 1 MHz. VBW= 3 MHz. BW = 600 MHz. SWT = 600 ms. MaxHold. Auto Sweep.	RMS	passed
7	7250 MHz – 10600 MHz	1	Op. mode- worst case.	RMS	passed
8	10600 MHz – 15000 MHz	1	Op. mode- worst case.	RMS	passed
9	15000 MHz – 18000 MHz	1	Op. mode- worst case.	RMS	passed
10	18000 MHz – 40000 MHz	1	Op. mode- worst case.	RMS	passed

Remark : see diagrams in annex 1 for more details.

Radiated field strength emissions test in frequency range $960 \, \text{MHz} - 1610 \, \text{MHz}$ was made as well for EUT A as for EUT B for the following reasons:

EUT A has been provided with additional cables for its placing into operation (see photos). These cables have caused additional EM emissions. Therefore the measurement for EUT A was made twice in some frequency ranges. Once with UWB signal turned on and once with UWB signal turned off. The frequency and the power of these EM emissions didn't match completely for the whole frequency range for both measurements- with UWB signal and without (see measurement diagrams). So the second identical sample (EUT B) without cables for its placing into operation (see photos) was measured to check, whether EM emissions of the EUT A above the limit line were caused by the cables for its placing into operation. The EUT B was measured in the same frequency range as EUT A with the UWB signal turned on. When measuring EUT B, no emissions were found above the limit line (see measurement diagrams).

The power of the UWB signal of both EUTs was measured with the same settings and then compared (to be sure that the EUTs are the same) (see Annex 5). Power difference of the UWB signal of two EUTs is less than 1 dB.

EUT B wat not used for all measurements, thus it needs much more time for taking it into operation due to the fact, that it doesn't have connection cables.

Diagrams for the above mentioned measurements are in the Annex 5.

Remark: frequency with the highest radiated emission contained within a 50 MHz bandwidth from the measurement according to FCC 15.517 5(c) is the frequency inside of the fundamental emission.

5.8. Antenna requirement according to FCC 15.203

The antenna is permanently affixed to the module.

5.9. Measurement uncertainties

The reported uncertainties are calculated based on the standard uncertainty multiplied with the appropriate coverage factor \mathbf{k} , such that a confidence level of approximately 95% is achieved.

For uncertainty determination, each component used in the concrete measurement set-up was taken in account and it's contribution to the overall uncertainty according it's statistical distribution calculated.

Following table shows expectable uncertainties for each measurement type performed.

RF-Measurement	Reference	Frequency range	Ca	Calculated uncertainty based on a confidence level of 95%					Remarks

757	CMW500 wide. Radio Comm.	CMW500	158150	Rohde & Schwarz	12 M	-	01.05.2017

8.1.3. Legend

Note / remarks		Calibrated during system calibration:
	1a	System CTC-SAR-EMS (RefNo. 442)
	1b	System-CTC-EMS-Conducted (RefNo. 335)
	1c	System CTC-FAR-EMI-RSE (RefNo . 443)
	1d	System CTC-SAR-EMI (RefNo . 441)
	1e	System CTC-OATS (EMI radiated) (RefNo. 337)
	1 f	System CTC-CTIA-OTA (RefNo . 420)
	1 g	System CTC-FAR-EMS (RefNo . 444)
	2	Calibration or equipment check immediately before measurement
	3	Regulatory maintained equipment for functional check or support purpose
	4	Ancillary equipment without calibration e.g. mechanical equipment or monitoring equipment
	5	Test System

Interval of calibration	12 M	12 month
	24 M	24 month
	36 M	36 month
	24/12 M	Calibration every 24 months, between this every 12 months internal validation
	36/12 M	Calibration every 36 months, between this every 12 months internal validation
	Pre-m	Check before starting the measurement
	-	Without calibration

9. Versions of test reports (change history)

Version	Applied changes	Date of release
	Initial release	2018-09-14
C1	Current release Differences to the initial release: Radiated field strength emissions test results for EUT A in frequency range 960 MHz – 1610 MHz were put in the separate Annex 5	2018-10-31

THE END OF THE REPORT
